

General AI Fluency: Assignment Submission

Week 6 Track: Open It on Your Phone • Ayush Raj Tiwary

Student Name: Ayush Raj Tiwary
Track / Phase: General AI Fluency • Build+ Phase
Live Portfolio: <https://artiwary.netlify.app/>
Repository: github.com/ARTiwary/portfolio

1. Mobile & Cross-Device Audit Summary

For this assignment, I opened my live portfolio (<https://artiwary.netlify.app/>) on a real mobile device and tested responsive breakpoints to audit layout behavior, touch targets, contrast, and performance.

Using AI-assisted auditing ("*What's broken on mobile, what's the accessibility problem, why is this slow?*"), I identified and resolved common mobile responsiveness slip-ups. All images were optimized, touch target paddings were expanded for mobile ergonomics, contrast ratios were verified, and every project demo and GitHub repository link was manually clicked and confirmed active.

2. The Fix Log (Before / After Notes)

Component / Area	What Was Broken (Before)	What I Changed (After)
Hero & Header Layout	The top badge cluster and hero banner text suffered from horizontal overflow on smaller screen widths (iPhone viewport), causing text truncation.	Applied responsive flex-wrap rules, adjusted padding, and scaled down container padding so badges stack cleanly without spilling out.
Project Card Buttons	Live Demo and GitHub buttons were too tightly packed and had small hit areas, leading to accidental mis-taps on mobile touchscreens.	Increased button touch targets (padding: 10px 16px), added spacing between buttons, and ensured minimum interactive target sizes of 48x48px.

Component / Area	What Was Broken (Before)	What I Changed (After)
Image Assets & Scaling	Project thumbnail images loaded full-size uncompressed assets, causing layout shift and slower initial paint speeds on mobile data.	Compressed oversized project images and added fluid CSS rules (max-width: 100%; height: auto;) to prevent image spilling.
Typography & Readability	Paragraph text and project descriptions on smaller viewports felt cramped with tight line-heights, reducing legibility against the dark background.	Adjusted base font scaling and set line-height to 1.6 with optimized contrast ratios to ensure effortless readability on OLED/mobile screens.
Link Integrity Check	Verified all outbound links to ensure no dead references.	Confirmed all 3 featured projects (MRI Tumor Detection, Smart Dining Assistant, Air Gesture Recognition) successfully point to their live deployments and active GitHub repositories.
